LUMINA

formerly Verity SCOPE

What We're Building & Why It Matters

A plain-English product brief with USP analysis and roadmap | For the entire team

Product	Market	Schema
Lumina (formerly Verity SCOPE)	**Healthcare PMR — B2B SaaS**	**SCOPE v1.2.4	Workflow v1.0.3**

PART 1 — What Is Lumina? The One-Liner

If someone asks you what Lumina does, say this:

> *"Lumina automates the way healthcare market research firms respond to client project requests — turning a messy email brief into a complete, ready-to-send proposal in a fraction of the usual time."*

Healthcare market research agencies receive client RFPs by email. Responding means producing a detailed proposal: costs, timelines, methodology, staffing plans, legal documents. Today this is done manually with spreadsheets and Word docs, taking days of senior team time. Lumina automates this entire back-office process.

The Problem Lumina Solves

The old way (Today)	The Lumina way (What we're building)
Client sends a vague email RFP	Lumina ingests the email, extracts all structured info automatically
Junior staff manually re-key info into spreadsheets	AI does the extraction; humans review and confirm
Senior researchers guess at sample sizes and costs	Rules engine calculates effort, costs, and sample options
Proposals take 3-5 days of back-and-forth	First draft proposal generated in hours
Every team member estimates differently	One standardised system across the whole organisation

The old way (Today)	The Lumina way (What we're building)
No audit trail — no one knows why a bid was priced that way	Full evidence trail: every number linked back to its source

PART 2 — The Industry Context Why This Market, Why Now

Healthcare PMR: A Quick Primer

Our customers are Primary Market Research (PMR) teams at specialist healthcare research agencies or in-house insight teams at pharma and MedTech companies. Their job: run studies with doctors (HCPs), patients, or payers to answer commercial questions for pharma clients.

A single project might involve:

- 300 oncologists across the US, Germany, and Japan
- A 20-minute online survey with conjoint analysis
- A 3-week fieldwork window, translated into 3 languages
- A full report, data tabbook, topline deck, and a readout session for the client
- Compliance with GDPR, HCP transparency laws, and fair market value rules on incentives

Scoping and pricing this correctly — in 48 hours — requires experienced people doing manual work every time. Lumina changes that.

Why Now? Five Market Tailwinds

Trend	Impact on our customers	How Lumina helps
AI/automation expectations rising	Clients expect 48-hr bid turnarounds as standard	Automates the most time-consuming bid steps
Talent squeeze	Experienced bid leads are expensive and scarce	Junior staff can do senior-quality scoping with Lumina guiding them
Compliance pressure increasing	GDPR, HCP transparency laws, adverse event tracking intensifying	Compliance fields and audit trail baked into every bid
More multi-country studies	Multi-market complexity scales badly with manual tools	Multi-country effort calculation is a core engine feature
Private equity consolidation	Agencies being rolled up need consistent processes across offices	Multi-tenant architecture: one platform for many offices

PART 3 — What Are We Building? The 13 Modules

Lumina is composed of 13 interconnected modules. Think of them as departments in a virtual bid office — each does a specific job, and together they take a brief from inbox to submitted proposal.

#	Module	What it does (plain English)	Key output
1	**Intake Hub**	Connects to email, reads incoming RFPs, stores all attachments. Creates one 'Opportunity' file per bid request.	*Opportunity record + email thread*
2	**Brief Parser**	Uses AI to extract key details: objectives, countries, audience, sample size, timelines. Scores how complete the brief is (0-100).	*Structured Brief + completeness score*
3	**Clarifications Engine**	Spots what's missing. Drafts a ready-to-send email asking the client the right questions. Logs default assumptions when client doesn't reply.	*Clarification email draft + assumptions log*
4	**Scope Builder**	Builds the research design: methodology, who to interview, in which countries, how many, what deliverables. Includes HCP shortlist from your internal database.	*Scope statement + sample plan + HCP shortlist*
5	**Workplan Builder**	Creates the timeline: milestones, client review windows, fieldwork dates. Flags unrealistic deadlines.	*Project timeline with milestones*
6	**Estimation Engine**	Breaks the project into tasks (WBS), calculates hours per role, applies complexity multipliers (5 languages = more hours). All rule-based and auditable.	*Work breakdown structure + effort in hours*
7	**Pricing Engine**	Applies your company's rate card to the hours. Adds out-of-pocket costs (panels, incentives, translation). Checks margins. Flags exceptions.	*Pricing pack + margin check + tiered options*
8	**Docs & Templates**	Generates Proposal, Statement of Work, and annexures from branded templates. Runs QC to catch inconsistencies before review.	*Proposal + SoW + annexures*
9	**Approvals & Governance**	Routes the bid to the right approvers (finance, legal, compliance). Logs every decision. If rejected, sends it back for rework.	*Approval decisions + audit log*
10	**Submission & Logging**	Prepares the final email with all attachments correctly named. Human clicks send. System records what was sent, when, and to whom.	*Submission email draft + submission record*
11	**Win Handoff**	When you win a bid, locks the approved scope and passes it to the delivery team. No re-keying. Change orders tracked post-win.	*Delivery handoff pack + locked baseline*
12	**Admin & Configuration**	Each company configures their own rate cards, templates, approval rules, vendor lists. Fully isolated between tenants.	*Tenant configuration + policy versioning*
13	**Analytics & Reporting**	Tracks bid cycle time, win rates, margin accuracy, rework frequency. Gives leadership visibility into bid operations.	*Dashboards + exportable metrics*

PART 4 — The End-to-End Workflow How a Bid Flows Through Lumina

Here is the journey a bid takes from client email to submitted proposal. This is the core product loop — the most important thing to understand.

1	**EMAIL ARRIVES**	Client RFP lands in the connected inbox with attachments. One 'Opportunity' is created.	*→ Opportunity + email thread stored*
2	**AI PARSES THE BRIEF**	System extracts objectives, audience, countries, sample size, timeline, deliverables. Scores completeness 0-100.	*→ Structured Brief — e.g. '82% complete, 3 gaps found'*
3	**GAPS FLAGGED**	Missing critical fields? System picks questions from a library and drafts a clarification email. No reply = logged default assumptions.	*→ Draft clarification email ready for human to send*
4	**SCOPE BUILT**	Research design locked: methodology, sample plan, quota grid, HCP shortlist (primary + backup), deliverables. 3 sample size options with cost/timeline impact.	*→ Scope statement v1 + HCP shortlist*
5	**WORKPLAN CREATED**	Timeline built: kickoff → fieldwork → analysis → reporting → readout. Client review windows included. Rush flags if deadline is tight.	*→ Workplan with milestones and dates*
6	**WBS + EFFORT CALCULATED**	Every task listed with rule-based hours. E.g. 'Survey programming: 3 languages x 1.5h x 1.3 LOI multiplier = 5.85h'. Fully auditable.	*→ Work breakdown structure + total hours per role*
7	**PRICING PACK BUILT**	Hours x rates = labour cost. Plus panel fees, incentives, translation, transcription. Margin checked. Good/Better/Best options generated if needed.	*→ Pricing pack + margin % + exceptions flagged*
8	**PROPOSAL DRAFTED**	Proposal + SoW + annexures generated from branded templates. QC run: numbers consistent? compliance fields present? costs add up?	*→ Proposal v1 + QC report*
9	**INTERNAL APPROVALS**	Routed to: scope approver, finance (margin/discount), legal/compliance. If rejected: back to rework with reason logged. Each loop increments version.	*→ All approvals = 'Approved to Submit'*
10	**SUBMISSION**	Final email + correctly named attachments prepared. Human reviews and clicks send. System records what, when, to whom.	*→ Submission record with timestamp*
11	**WIN OR LOSE**	Won: locked scope snapshot passed to delivery team (CRAFT). No re-keying. Lost: archived with reason for future learning.	*→ HandoffPack for delivery OR archive record*

PART 5 — Key Concepts Words You'll Hear Every Day

These terms come up constantly in Lumina. Every team member should know them.

Term	What it means in plain English
Opportunity	One bid. One client request. The root file everything else hangs off.
Brief	A structured version of what the client asked for, extracted from their email/RFP.
Completeness Score	A 0-100 score for how much of the brief we have. Below threshold = triggers clarification questions.
WBS (Work Breakdown Structure)	The full task list for a project with hours per role. The engine room of the cost estimate.
Multiplier	A factor that increases hours based on complexity. E.g. 3 languages = 1.3x programming hours.
OOP (Out-of-Pocket)	Non-labour costs: panel fees, doctor incentives, translation, transcription, facility hire.
Rate Card	A company's hourly rates per role — what it costs them, and what they charge clients.
Tenant	One company using Lumina. Each company's data is completely isolated from all others.
Study Family	Top-level research type: Understanding, Tracking, Testing, Trade-off, Segmentation, or Pricing.
Study Type	More specific: U&A, Tracker, Concept Test, Conjoint, MaxDiff, etc. Drives the default task list.
HCP Shortlist	A ranked list of doctors selected from an internal database to recruit for a study, with a backup pool.
Baseline Package	When a bid is won — a locked snapshot of approved scope passed to the delivery team.
CRAFT	Lumina's companion product for the delivery phase. SCOPE handles bidding. CRAFT handles execution.
FieldEvidence	A link from a data point (e.g. 'sample = 300') back to the exact line in the client email it came from.

PART 6 — Who Uses Lumina? Roles and Responsibilities

Lumina is designed around the reality of a bid team. Different people touch the bid at different stages.

Role	Their job	What they do in Lumina
Bid Lead / Bid Desk	Owns the bid response end-to-end	Reviews brief, approves assumptions, approves scope and pricing, submits bid
Research Lead	Owns research design quality	Confirms methodology, sample plan, analysis approach, deliverables list

Role	Their job	What they do in Lumina
Project Manager	Owns timeline and feasibility	Builds workplan, manages review cycles, checks deadline is achievable
Analyst / Associate	Supports content and analysis	Drafts sections, builds tab plan, checks outputs
Programmer	Builds survey scripts (quant studies)	Validates programming effort and LOI complexity assumptions
Fieldwork / Operations	Runs recruitment and fieldwork	Feasibility checks, vendor coordination, pacing QC
Finance Approver	Protects margin and discount policy	Approves exceptions, discount overrides, margin threshold breaches
Legal / Compliance	Contract and data privacy oversight	Approves SoW deviations, consent language, data handling requirements
Tenant Admin	Runs the platform for their company	Configures rate cards, templates, approval rules, integrations, users

What users do NOT have to do manually

Lumina extracts the brief from emails automatically. Users don't re-key data — they review and confirm. This is a core design principle: the system does extraction work, humans provide judgement.

PART 7 — Our USP Why Customers Should Choose Lumina Over Everything Else

The Competitive Landscape

Lumina sits at a specific intersection that very few tools currently occupy:

Category	Examples	Why they fall short for our customers
Generic proposal tools	Proposify, PandaDoc, Qwilr	No PMR study library, no estimation engine, no healthcare compliance fields
CRM systems	Salesforce, HubSpot, Dynamics	Pipeline management only — no scoping, no WBS, no pricing engine
Project management tools	Smartsheet, Monday.com, MS Project	Delivery-focused; not designed for bid creation at all
Consultancy Excel/Word tools	Internal templates at most agencies	No automation, no audit trail, not scalable, knowledge walks out the door
BI/analytics platforms	Tableau, Power BI	Reporting only; don't touch the bid creation process
LUMINA	—	The only purpose-built, end-to-end bid automation platform for healthcare PMR

Our 5 Core USPs

	USP	What it means in practice	Why competitors can't easily copy it
1	**Healthcare PMR-specific intelligence**	Built around real study types, HCP audiences, compliance constraints, and deliverable standards of the industry. Not a generic tool bent into shape.	*Requires deep domain knowledge baked into the study library, task definitions, and compliance fields. Can't be replicated with a generic product.*
2	**Evidence-linked audit trail**	Every assumption, every number, every decision traced back to its source — the exact line in the email or attachment it came from. Full defensibility.	*Requires a fundamentally different data model (FieldEvidence objects). Nearly impossible to retrofit onto an existing product.*
3	**Deterministic, auditable estimation**	The WBS engine uses rules — not AI guesswork — to calculate hours. Every multiplier is logged with its reason. Bids are reproducible and comparable.	*Most AI tools produce black-box outputs. Our rules engine means any finance director can see exactly why a bid costs what it costs.*
4	**Multi-tenant, white-label ready**	One platform, many companies. Each company configures its own rate cards and templates while benefiting from the shared global study library.	*Requires architectural decisions made at the start. Nearly impossible to retrofit onto a single-tenant product.*
5	**Scope-to-delivery continuity (CRAFT)**	When a bid is won, the locked scope passes directly to the delivery tool (CRAFT) with no re-keying. Change orders tracked and re-approved if scope drifts.	*Requires both products to exist and share a data model. Very high barrier to entry for any new entrant.*

How to Position Lumina in Any Conversation

Opening pain statement

"How long does it take your team to turn around a bid right now? And how consistent is the pricing between your senior and junior bid leads?" — Most PMR teams will admit: days of effort, major inconsistency. That is the door Lumina walks through.

Three proof points to always have ready:

- Speed: From email RFP to first-draft proposal in hours, not days
- Consistency: Every bid uses the same study library, task definitions, and multiplier logic — regardless of who builds it
- Defensibility: Every assumption and every number is traced back to its source — your finance and legal teams will love this

PART 8 — Product Roadmap What We Build and When

Phase 1 — MVP The Core Bid Loop

Goal

Get a paying customer from email RFP to submitted proposal, end-to-end. Everything else is secondary until this loop works flawlessly.

Module / Feature	Priority	Why it's in MVP
Email intake + thread storage	MUST	Email is how all briefs arrive. Non-negotiable starting point.
Brief parser (AI extraction + manual edit)	MUST	Core value: turns email chaos into structured data.
Completeness scoring + clarifications engine	MUST	Without this, every bid is built on guesswork.
Study library v1 (core study types)	MUST	Estimation engine cannot work without study type definitions.
Scope builder (sample plan, deliverables)	MUST	The heart of the product — what customers are actually paying for.
Estimation engine (WBS + multipliers)	MUST	The efficiency gain that justifies the purchase.
Tenant rate card configuration	MUST	Without rate cards, pricing cannot work.
Pricing pack (labour + OOP + margin check)	MUST	Revenue impact is the number one justification for budget approval.
Proposal + pricing annex generation	MUST	Customers need to see a document come out.
Scope + pricing approval gates + audit log	MUST	Finance and compliance teams require this before any client will approve use.
Submission email draft + submission record	MUST	Closes the loop. Without this, users still do final steps manually.
HCP shortlist (basic version)	SHOULD	High differentiator; can defer full ranking model to Phase 2 if needed.
Sample size recommendation (3 options)	SHOULD	Powerful feature; can be semi-manual at MVP.
Workplan builder	SHOULD	Important but can be a simple template-based approach at MVP.

Phase 2 — Growth Features Win the Enterprise Deal

Feature	Why Phase 2 (not MVP)
CRM integration (Salesforce / Dynamics / HubSpot)	Most large agencies have a CRM. Integration removes duplication and drives platform stickiness.
Procurement integration (Coupa)	Critical for pharma in-house teams where every vendor engagement needs a purchase order.

Feature	Why Phase 2 (not MVP)
Template editor UI + clause library management	Self-service reduces dependence on the Lumina team for every template change.
Historical benchmark learning	As data accumulates, system suggests base hours from similar past projects — a compounding data advantage.
Advanced analytics dashboard	Win rates, margin accuracy, cycle time — leadership demands this for ROI proof.
Good / Better / Best tiered pricing	Commercial teams love offering options. Increases average deal value.
CRAFT delivery handoff (full integration)	The vision: seamless scope-to-delivery platform. Our strongest long-term moat.

Phase 3 — Platform Become Indispensable

Feature	Strategic intent
Change order management (post-win scope changes)	Prevents revenue leakage. Any post-win change is tracked, re-priced, and re-approved.
Win/loss analysis and pattern recognition	Data flywheel: the more bids processed, the smarter the platform gets at predicting outcomes.
Multi-language UI	Opens European and Asian markets where substantial healthcare PMR is conducted.
Vendor portal integration	Direct connection to panel providers for real-time feasibility checks at scoping time.
Client-facing portal	Clients submit briefs and receive proposals directly through a branded portal.
AI-powered proposal narrative drafting	LLM-drafted proposal text (scoped sections only) — with mandatory human review.

PART 9 — Critical Success Factors and Risks to Watch

Risk / Factor	Why it matters	What to do about it
Study library quality	Wrong task definitions or multipliers = every estimate is wrong. The whole platform rests on this.	Involve experienced PMR practitioners in building and validating the study library before launch.
Brief parsing accuracy	If AI misreads the brief, everything downstream is wrong. Users will stop trusting the system.	Build a strong human review step into the UX. Low confidence = prominent warning. Users must confirm, not skim.
Rate card onboarding friction	If uploading rate cards is hard, customers give up before they see value.	Build a simple, forgiving rate card upload flow. Support CSV templates. Offer to do the first upload for them.

Risk / Factor	Why it matters	What to do about it
HCP data compliance	HCP shortlists touch doctor contact data — regulated in most markets.	Keep HCP IDs internal only. Never expose PII in any output. Make compliance assumptions visible in every proposal.
Approval workflow rigidity	Every agency has different approval rules. Too rigid = won't fit real workflows.	Make approval routing fully configurable per tenant. Don't hardcode any approval chains.
Perceived time saving	If the 'automated' version takes as long as manual because reviews are clunky, customers churn.	Obsess over the review UX. Every click to confirm must be fast. The review step is the product's crucible.

PM Priority Note: Onboarding is everything

Getting a customer to complete initial setup (rate cards, templates, email connection) is where most SaaS products lose momentum. Invest in a guided onboarding flow, pre-filled templates, and an implementation checklist. The faster a customer sees their first generated proposal, the more likely they stay.

The one thing to remember about Lumina:

We give healthcare research teams back the one thing they never have enough of —

time to do great research, instead of spending it on admin.
